1.- RhizoBindigSites and RhizoBindigSites v2.0 version :

RhizoBindingSites and the v2.0 version databases contain information with a potential role in the transcriptional regulation from nine representative species of the taxon Rhizobiales.

2.- Construction of the databases: RhizoBindingSites database was constructed with matrices deduced from ortholog genes from each gene per genome. In contrast, RhizoBindigSites v2.0 was constructed with matrices by using the short nucleotide sequences from the motif sites for each gene per genome from the matrix-scan output data of RhizoBindingSites. Highlighting, matrices of the RhizoBindingSites v2.0 were deduced from the respective genome sequences.

RhizoBindingSites and RhizoBindingSites v2.0 are revised databases, because all data included is from matrices able to find a motif in their coding string on its regulatory region. As well as, data from matrix-scan deposited in the “Motif Information” window (see below) are with motifs found only on the string codifying the gene from target-genes.

3.- Mission: To provide information with a potential role in transcriptional regulation of genes at three ranges of p-values, from 1.0e-4 to 9.9e-4 (low stringency data), from 1.0e-5 to 9.9e-5 (medium stringency data) and from 1.0e-6 to lower p-values (high stringency data).

4.- Selection of RhizoBindingSites or RhizoBindingSites v2.0 version.

Access to the v2.0 version is by clicking on the legend “Switch to v2” on the main page of database RhizoBindingSites. The functionality of RhizoBindingSites v2.0 windows and the application “Prediction of Transcriptional regulatory networks” is equal to the RhizoBindingSites, se below.

5.- Synonyms converter. For cases in which the User’s Identifiers do not coincide with the ones used in these databases, a list of identifiers synonyms for each of the genomes was included with an application to convert their locus tags to the locus tags used in these databases. Paste their list on the window and run the program, you may copy your equivalent list of Locus tags formats: ***Rhizobium etli* CFN42** (RHE_RS), ***Rhizobium etli* Mim1** (REMIM1_RS) , ***R. leguminosarum biovar viciae* 3841** (RL_RS), ***Bradyrhizobium diazoefficiens* USDA 110** (AAV28_RS), ***Sinorhizobium fredii* NGR234** (NGR_c), ***Sinorhizobium meliloti* 1021** (SMc), ***Bradyrhizobium sp* BTAi1** (BBTA_RS), ***Azorhizobium caulinodans* ORS 571** (AZC_RS), ***Mesorhizobium japonicum* MAFF303099** (MAFF_RS).

6.- Criteria for selecting a motif: Better selection of a motif should involve many parameters provided in the RhizoBindingSites database such as: motif with the lowest p-value (medium or high stringency data), motif sequence (avoid as possible repeated nucleotide repeated in the motif), conservation of the motif in orthologous genes in the Rhizobiales taxon, coherence of the function of the gene query with genes sharing the motif, look for the query gene has a vicinity with a transcriptional regulator. Additionally, it is advisable to search for information in the scientific literature on the expression in the same physiological condition of both, the transcriptional regulator and the gene-target.

7.- Motif Information window: Provides a table with a locus tag identifier of genes sharing query motifs (e-regulon), gene strand location, matrix identifier, strand location of the matrix, start/end

position of the motif in the gene promoter, nucleotide sequence of the motif, weight, p-value and significance of the site.

Select a genome.

10.- Prediction of Regulons or transcriptional regulatory networks. This application is in the motif information window. It is for prediction of regulons from experimental or predicted data by writing or pasting a list of locus tags of transcriptional regulators into the left box, and a list of locus tags from the complete list of target proteins, including the transcriptional regulators in the right box. There is a demo in the Genome section of *Rhizobium etli* CFN42. The application for each transcriptional regulator (from the left box) will search for common genes in the data from motif information with the entered list, from the right box, which also contains the transcriptional regulators of the left box.

Prediction of regulatory networks

This app for hypothetical or experimental data displays a cytoscape graph showing a genetic circuitry from a stimulon at the desired low (p-value $1e-4$), medium (p-value $1e-5$) or high stringency (p-value $1e-6$ to lower p-values) from the motif information table, the option "auto" searches firstly with the highest then with the medium and finally with the low level of stringency, showing data with the highest stringency p-value.

Paste a list of transcriptional regulators (left) and a list of genes (one per line) including the transcriptional regulators (right)

[Demo](#)

- etli* CFN42 auto
- etli* CFN42 fraction p-value $1.0e-4$ to $9.9e-4$
- etli* CFN42 fraction p-value $1.0e-5$ to $9.9e-5$
- etli* CFN42 fraction p-value $1.0e-6$ to lower p-values (faster)

Select the strain *Rhizobium etli* CFN42. Click on the "demo" link to enter a demo list. Select the "auto" option. Alternatively, you may select a p-value for the search.

The Transcriptional regulators are:

RHE_RS27920
RHE_RS26495
RHE_RS24540
RHE_RS24045
RHE_RS17450
RHE_RS13800
RHE_RS08785
RHE_RS04880
RHE_RS04030

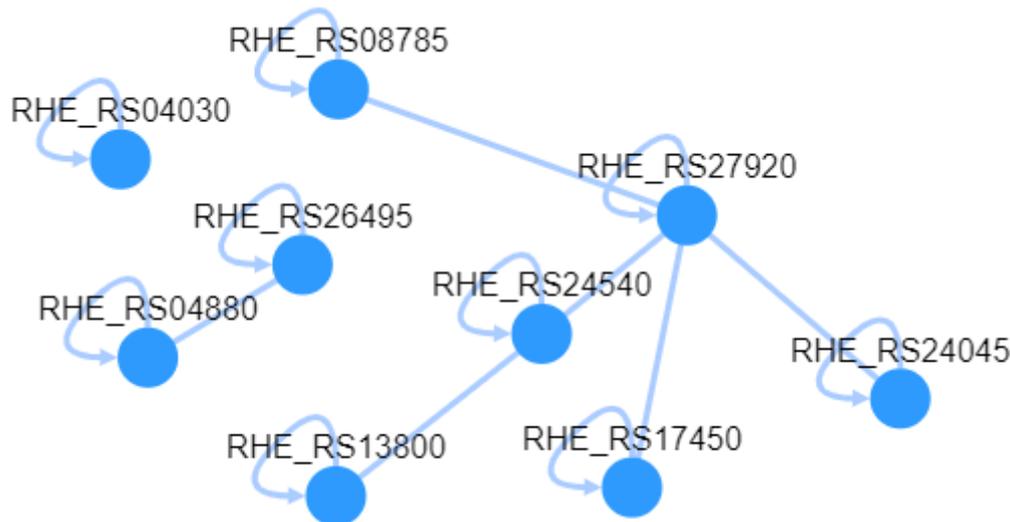

6.- Paste the transcriptional regulators in the left box of the application “Prediction of regulons” and type the RHE_RS00040 locus in the right box. Download the data. You see this output:

Locus_tag	Upstream_region	Matrix_ID	Chain	End_motif	Start_motif	Site	Weight	P_value	Ln_P_value	Significance
RHE_RS00040	R	RHE_RS26495_m3	D	-73	-59	GATGAT TCAAATGAT	9.8	8.10E-06	-11.724	5.092

These data showed the RHE_RS26495_m3 matrix of the Transcriptional regulator RHE_RS26495 found a motif in the regulatory region of the RHE_RS00040 gene, which is not a TF-gene.

14.- Example of how to use the matrix-scan data to search how the transcriptional regulators may be interacting with the potential target genes.

- 1.- Select the genome *Rhizobium etli* CFN42
- 2.- Go to the Gene Information window
- 3.- Introduce the gene sample (RHE_RS00040), select the p-value 1e-6 to lower p-values
- 4.- Download the file in a tsv format and open it with a gedit editor, make a copy and paste in an Excel sheet as in the previous example
- 5.- Select and order the columns by the COG group, copy all the transcriptional regulators (nine transcriptional regulators) as in the previous example
- 6.- Paste the transcriptional regulators in both, the left and right boxes of the application “Prediction of regulons” click on see network graph.

This is a cytoscape network graph, it is an example of how the transcriptional regulators may be interacting from the expected regulon RHE_RS00040, with the option “auto”.

15.- Matrix-clustering. All the motifs represented in a matrix from only Transcription factors (TF’S) were grouped by its homology with the matrix-clustering program (Castro-Mondragon et al., Nucleic Acids Research (2017). This data show groups of TF’S sharing homology in their matrices,

consequently they potentially may be inter-regulated forming regulons, see **RhizoBindingSites v2.0 is a database of DNA motifs potentially involved in transcriptional regulation deduced from sites of the genome** Taboada-Castro et al., 2023. Access is by clicking on the Matrix Clustering button, this will open a new window in their server. Once you see the “RSAT – matrix-clustering result” page, you have access to the data by clicking on the Logo Forest (dynamic browsing), Logo forest (rapid overview-low image quality), Clusters Summary, Individual Cluster View, Individual Motif View, Heatmap View and Additional Files (Castro-Mondragon et al., Nucleic Acids Research (2017), all the information is available. Since one TF may have more than one matrix, frequently, a cluster is formed with matrices from the same gene. To see the cluster formed with more than one different gene, see the Supplementary Table 2.- Matrix-clustering_Analysis of the O_and_S_matrices of the above-mentioned manuscript.

16.- A Brief guide to analyze a genome in the RSAT web site <http://embnet.ccg.unam.mx/rsat/>.

In order to carry out an analysis of another genome, below is a brief introduction to the RSAT website <http://embnet.ccg.unam.mx/rsat/> which is a specialized site to analyze a pre-charged genome.

For the analysis of a genome other than that of Rhizobiales taxon, go to the RSAT web server located at <http://embnet.ccg.unam.mx/rsat/>, this site contains 56 programs for DNA sequences analysis (Nguyen et al., 2018), this site is made up of five distinct servers. For bacteria, you can choose RSAT-prokaryotes server, this site contains files for footprinting discovery algorithm like; the sequence of the bacterial genomes, the groups of orthologs, the upstream sequences and the background model. To get a footprint discovery algorithm, go to the page http://embnet.ccg.unam.mx/rsat/footprint-discovery_form.cgi. This page contains all the windows that the user needs to fill out and to submit the footprinting discovery algorithm, at the bottom of this program there is an example of how to complete this command by clicking on the “DEMO”, it shows how to fill out the form to discover the motif in the promoter region of the E. coli *lexA* gene as an example, there is also a “sample Output” of the data, showing a file HTML output, click on the “Query” gen “*lexA*” link to obtain all the files with data used for the deduction of the *lexA* motif and the motif in logo format, as well as a footprint scan showing the conservation of the motifs discovered from *lexA* in members of the taxon Enterobacterales. This algorithm has the alternative of executing a single gene, a group of genes or a genome in the “Query genes” window. The deduced matrices are in the file with a “.tf” extension. The matrices are in transfac format, with these matrices you can run a matrix-scan analysis on the site http://embnet.ccg.unam.mx/rsat/matrix-scan-quick_form.cgi. With these simple steps you can analyze a pre-charged genome in the RSAT site just as we did for the RhizoBindingSites database.
